

CAPITAL DISTRICT DATA

NOVEMBER/DECEMBER 2011

VOLUME 34, NUMBER 6

2010 NAICS Sector Employment Data

The New York State Department of Labor has recently released the 2010 NAICS-based employment data for NYS counties.

The following table presents 2010 major sector data for average annual employment and pay for the Capital Region.

The tables on pages two through four contain the location quotients and basic industry employment for each of the Region's four counties, the Capital Region, and New York State. Location quotients are based on an analytical technique that compares a local economy to a reference economy (typically the US) to identify specializations, if any, in the local economy. The location quotient technique is based upon a calculated ratio between the local economy and the reference unit

economy.

$$LQ = \frac{\left(\frac{RE_i}{RE_t} \right)}{\left(\frac{NE_i}{NE_t} \right)}$$

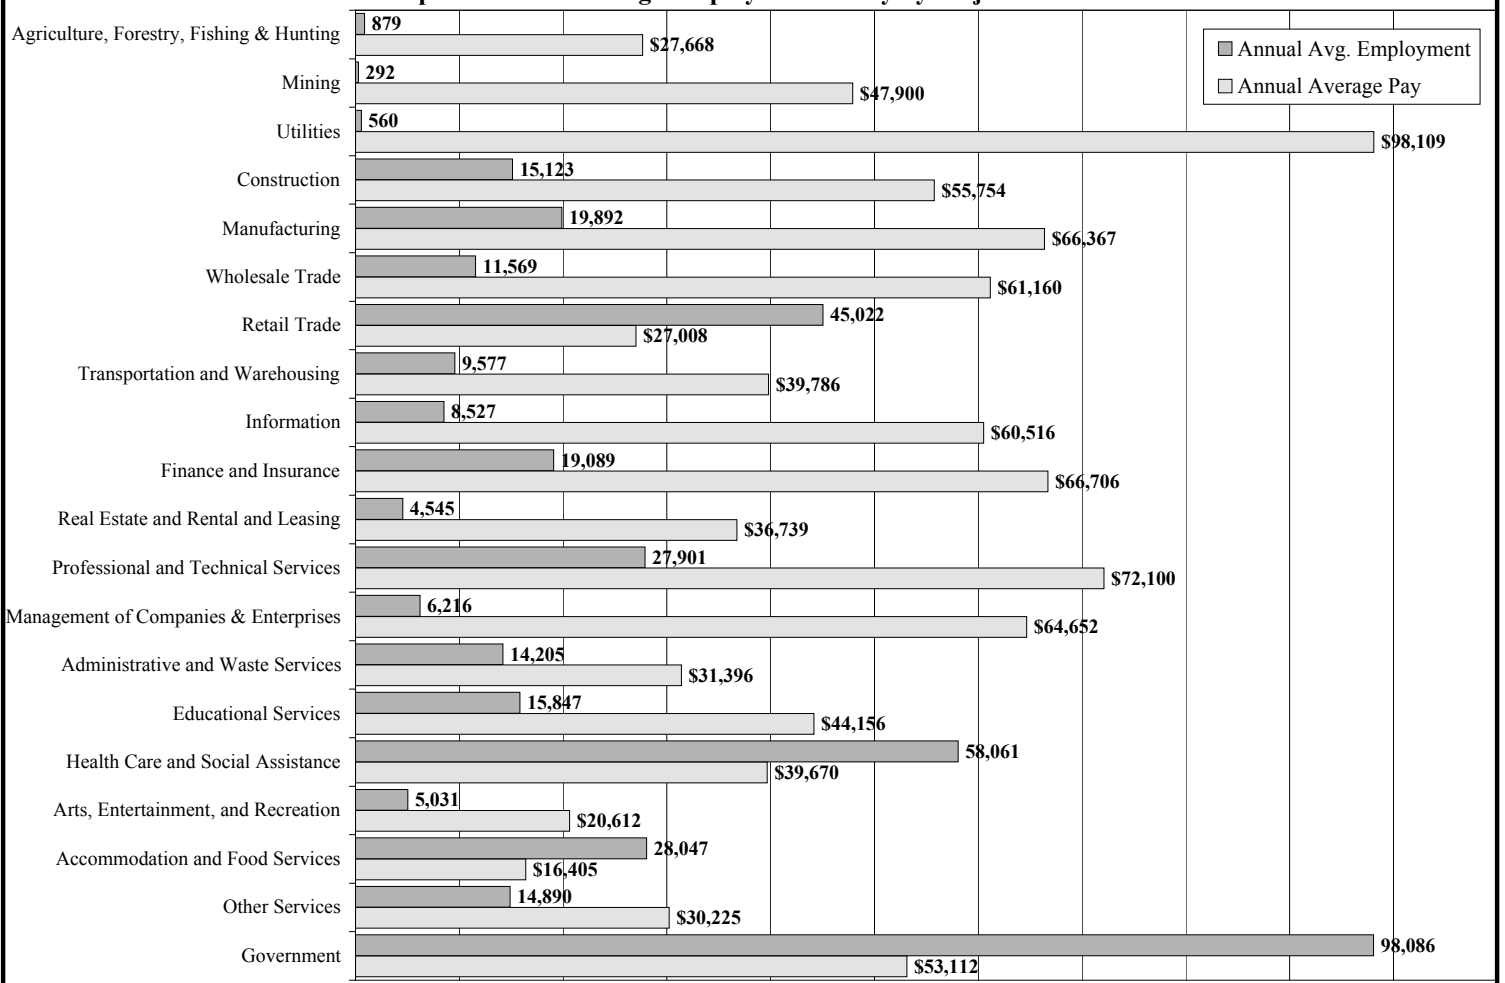

LQ = Location Quotient
 RE_i = Sector i Local employment
 RE_t = Total Local employment
 NE_i = Sector i U.S. employment
 NE_t = Total U.S. employment

An LQ less than one (< 1) for an industry suggests that industry is not meeting local demand for its goods or services.

An LQ of one ($= 1$) for an industry suggests that industry's output is sufficient to meet local demand for its goods or services, but provides no net exports to other areas.

Employment & Unemployment figures in 1,000s

2010 NAICS Sector Employment Data

continued from p. 1

An LQ greater than one (>1) for an industry suggests that industry both satisfies local demand and exports goods or services to other sectors.

The employees engaged in producing goods or services for export to other areas above and beyond that required for local consumption are termed "basic industry employment."

The basic industry figures clearly show that the Capital Region has a significant number of employees providing export goods or services. For 2010, approximately 51,799, or 10.6% of the Region's jobs, represented basic industry employment. Over half of the Region's basic industry employment in 2010 was in the government sector.

Some caveats on the use of LQ analysis:

- Since on a net basis the US consumes far more goods than it produces, manufacturing LQs may understate the number of industries which export in a region.
- The US produces far more of some services than it consumes (e.g., entertainment), so certain service sector LQs may understate their actual exports.
- No region will consume the same proportion of goods and/or services that are represented by the proportion of US employees involved in producing them, so all LQs are rather rough estimates.
